

ITSE-1402 Intermediate Python

Class 3: Classes and Objects | Project 1

June 8, 2017

A decorative light blue triangle is located in the bottom right corner of the slide, pointing towards the top right.

Real programmers set the universal constants at the start such that the universe evolves to contain the disk with the data they want.

- What are classes?
- What are they used for?
- Using classes to create types

- **What are classes?**
 - What are they used for?
 - Using classes to create types
- Classes are the *object* in OOP
 - Classes create new types of objects
 - Classes contain methods or functions to modify the objects they create

- What are classes?
- **What are they used for?**
- Using classes to create types

- We know the different default python types:
 - string
 - int
 - float
 - list
 - dict
 - etc.
- They have methods such as:
 - `str.count(arg)`
 - `list.pop()`
 - etc.

- What are classes?
- **What are they used for?**
- Using classes to create types

Example Class:

```
class BankAccount(object):  
    def __init__(self):  
        self.balance = 0  
  
    def withdraw(self, amount):  
        self.balance -= amount  
  
    def deposit(self, amount):  
        self.balance += amount  
  
a = BankAccount()  
a.deposit(100)
```

- What are classes?
- What are they used for?
- **Using classes to create types**

Classes Encourage Atrocities

- OAuth2 implementation
- <http://code.google.com/p/google-api-python-client/source/browse/>
□
- 10,000 SLOC, 115 modules, 207 classes
- *"I decline any responsibility for Google API client code."* -- Guido Van Rossum

```
class Flow(object):  
    """Base class for all Flow objects."""  
    pass  
  
class Storage(object):  
    def put(self, data): _abstract()  
    def get(self): _abstract()  
  
def _abstract(): raise NotImplementedError
```
